

Bosch Relay

The Power Relay is used to isolate power of the outside environment from the sensitive electronics. Do make a note of how to connect them correctly in the drawings. In some instances a freewheel diode may be required across pin 85 and 86. See the connection below.

Important to take note on the numbers and the placement on the relay. Some replacement relays have placed them in different positions which means, if you have a relay holder that is prewired it will then be incorrectly connected to the system.
