Android Pack

With the Android software you have the tuning and selections of your ECU or TCU in your pocket at all times. This is handy if you want to change limiters or functions that is normally pre-set for when someone else also use the vehicle. You may activate pops and bangs for one moment and later convert to normal launch features for racing again. It is also handy to do datalogging around a track as the laptops don't usually work in race cars.

ECU and TCU Tuning Software for Android Mobile Phones with Blue-Tooth are available for Ver 3.6 and later versions of firmware. This is achieved by a Blue-Tooth dongle and mobile activation of each device. They are sold separately as you may use the same module for more applications. The module can also connect to PC Hyperspace software with no mobile activation. A special price is offered should you buy the module and activation.

The software is a complete tuning package on your phone except for Matrix on the ECU software at this stage. However, you can have a matrix tuned box connected to it and change other settings or use your phone as a datalogger. You can send the data file and Map to a tuner with a laptop and he can do alterations and send the file back to your phone to be loaded into the ecu again. You can download the Android Software and demo map to view the operation before buying.
